

Product data sheet

MedKoo Cat#: 329019 Name: Dapoxetine HCl CAS#: 129938-20-1 (HCl) Chemical Formula: C ₂₁ H ₂₄ ClNO Molecular Weight: 341.879		
Product supplied as:	Powder	
Purity (by HPLC):	≥ 98%	
Shipping conditions	Ambient temperature	
Storage conditions:	Powder: -20°C 3 years; 4°C 2 years. In solvent: -80°C 3 months; -20°C 2 weeks.	

1. Product description:

Dapoxetine HCl, also known as Priligy and LY-210448, is a selective serotonin reuptake inhibitor used to treat premature ejaculation in men.

2. CoA, QC data, SDS, and handling instruction

SDS and handling instruction, CoA with copies of QC data (NMR, HPLC and MS analytical spectra) can be downloaded from the product web page under “QC And Documents” section. Note: copies of analytical spectra may not be available if the product is being supplied by MedKoo partners. Whether the product was made by MedKoo or provided by its partners, the quality is 100% guaranteed.

3. Solubility data

Solvent	Max Conc. mg/mL	Max Conc. mM
DMSO	16.0	46.80
Ethanol	25.0	73.13

4. Stock solution preparation table:

Concentration / Solvent Volume / Mass	1 mg	5 mg	10 mg
1 mM	2.93 mL	14.63 mL	29.25 mL
5 mM	0.59 mL	2.93 mL	5.85 mL
10 mM	0.29 mL	1.46 mL	2.93 mL
50 mM	0.06 mL	0.29 mL	0.59 mL

5. Molarity Calculator, Reconstitution Calculator, Dilution Calculator

Please refer the product web page under section of “Calculator”

Product data sheet

7. Bioactivity

Biological target:

Dapoxetine (hydrochloride) is an analytical reference standard that is categorized as a selective serotonin reuptake inhibitor and provides improvement in several parameters related to premature ejaculation in clinical trials.

In vitro activity

The purpose of this study was to investigate the therapeutic efficacy of transdermal delivery of DH (Dapoxetine HCl) in transthesosome nanovesicles (TENVs). The TENV formulations were assessed for entrapment efficiency (EE-%), vesicle size, zeta potential, in vitro DH release, and skin permeation. The release behavior of DH from DH-TENVs was investigated to confirm whether the DH-TENVs had the ability to release DH in a sustained manner. Rapid DH release from free DH solution in the dialysis bag was observed, with approximately 95% of the DH being released in the first 3 h (Figure S1A–C). In contrast, the DH in DH-TENVs demonstrated a slow and controlled release, with about 53–85% of the DH being released within 8 h (Table 2). The results indicate that DH-TENVs can improve transdermal delivery of DH and thereby alleviate RA.

In vivo activity

The effects of 8-OH-DPAT and dapoxetine on the sexual behavior of male rats were investigated in this study. Dapoxetine significantly reduced the ejaculation performance at a dose of 60 mg/kg by delaying the latency of mounts and decreasing the latency of ejaculation and post-ejaculatory interval. Significant differences in the gene expression profiles were observed in the EJ (257 genes), DPAT (349 genes) and the DAP (207 genes) compared with the control rats. In the present study, Drd4 was significantly upregulated (fold change: 2.42) following dapoxetine treatment whereas no such trend was noted regarding other 5-HT receptor or transporter genes.
